## How we detect Endometriosis.

- Endometriosis secretes Prostaglandins.
- This causes epileptic-like frequency changes in bowel myoelectrical activity.
- Changes occur in a typical drug-dose-response curve manner.
- This results in a myoelectrical fingerprint only found with endometriosis.

The TRICORDER-3L detects this unique endometriosis-specific fingerprint.

## 30 Minute, Non-Invasive and Highly Cost Effective

The EndoSure Test is easy to perform and provides a simple, objective result. It detects all stages of endometriosis.

The test is suitable for post-treatment diagnostic vigilance as well as a routine screening program.
